En este artículo incluyo este script para cambiar los DNS en un servidor o equipo Windows mediante PowerShell, espero que os pueda ser de utilidad.

```
#-------------------------------------------------------------------------------

# Script for Windows Server 2016 and Windows Server 2012R2

# by Javier Sanchez Alcazar # Citrix CTP (2009-2016), Microsoft MVP(2011-2014) and Microsoft MVP Reconnect

# DNS Server change to Start logon

#--------------------------------------

Set-ExecutionPolicy Unrestricted

# Import modules

Import-Module Dism

Import-Module PSDesiredStateConfiguration
```

```
Import-Module WindowsErrorReporting

Import-Module ScheduledTasks

Import-Module CimCmdlets

Import-Module RemoteDesktop

Import-Module ServerManager

#-----------------------------------------------------------------------------------------------

# Variable definition

#-----------------------------------------------------------------------------------------------

#

# Read the Network configuration for apply changes

$nic = Get-WmiObject Win32_NetworkAdapterConfiguration -filter "ipenabled = 'true'"
```

```
#

#-----------------------------------------------------------------------------------------

# End variable definition

#-----------------------------------------------------------------------------------------

Write-Host "-------------------------------------------------------------"

Write-Host "Server DNS Change process"

Write-Host "-------------------------------------------------------------"

$DNS1="192.10.20.1","192.10.20.2"

$dns = $DNS1  $nic.SetDNSServerSearchOrder($dns)

Write-Host "Network configuration is Modified"

#-----------------------------------------------------------------------------------------

# End of Code/PowerShell
```
